Choose the three daily use apps that you want and you are set. You do not need Photoshop. It's almost worth buying the MacBook Air for the addition of Photoshop, which I suspect is why Apple made that choice.

The size and speed of the installation is fairly quick, although I'm surprised by how many video codecs are needed, with the exception of Darktable, which I'm told needs two as well. Photoshop is renowned as a picture editor. There's nothing else quite like it in the industry. Like a lot of other things, Photoshop is a general-purpose tool; people don't usually use it to do just one thing well. You can do a lot of image-editing with it. You can do a lot of other things as well, but you will find details and limitations unless you're a real expert and know what you're doing. Photoshop also exhibits weaknesses, such as file-management issues. You don't want to lose your precious holiday photos because they didn't "go" the way you intended. Photoshop also is a "tracking" tool—it will save all sorts of information about what you've built and what you've moved around, and it can get on your nerves. However, you can also set up a file to automatically save, and the programs will make a copy before deciding to do something.
